Code Test: React Developer

Instructions

Imagine that you are building an online shop for a flower store. At checkout, the user has the option to choose one or more special coupons to add on top of their order. Design and implement a UI in React to select and confirm these special coupons.

It is not necessary to build an API for this test. User interactions need only result in UI changes. Surrounding UI elements like navigation are not necessary. Please do not use any other libraries to implement this challenge other than those libraries necessary to build and test React components.

You should use the following data as inputs to your component(s). These are the coupons:

```
[
    {
        id: 1,
        name: "Autumn Promo",
        product: "Chrysanthemums"
        price: 21.00,
        end_date: 2019-08-10
    },
    {
        id: 2,
        name: "Sale of the century",
        product: "Lilacs",
        price: 10.00,
        end_date: 2019-07-01
    },
    {
        id: 3,
        name: "24 Hour Sale",
        product: "Roses",
        price: 19.00,
        end_date: 2019-05-09
    }
]
```
